

Vector and tensor norms

- Measure of the size, or magnitude of a vector or tensor
- Definition: The following criteria qualify $f(\cdot)$ as a norm:
 - Positive definite: $f(\mathbf{x}) = 0 \iff \mathbf{x} = \mathbf{0}$
 - Triangle inequality: $f(\mathbf{x} + \mathbf{y}) \leq f(\mathbf{x}) + f(\mathbf{y})$
 - Homogeneity: $\forall \alpha \in \mathbb{R} : f(\alpha \mathbf{x}) = |\alpha| f(\mathbf{x})$
- The ones we care about are:

- Lp norm:
$$\|\mathbf{x}\|_p = \left(\sum_i |x_i|^p \right)^{1/p}$$

- Frobenius norm:
$$\|\mathbf{A}\|_F = \sqrt{\sum_{i,j} A_{i,j}^2}$$

Distance metrics

- The two distance metrics used most often in machine learning are the Manhattan (L1) and Euclidean (L2) distances, which can be defined using the Lp norm:

- Manhattan:
$$\|\mathbf{x}_1 - \mathbf{x}_2\|_1 = \sum_i |x_i^{(1)} - x_i^{(2)}|$$

- Euclidean:
$$\|\mathbf{x}_1 - \mathbf{x}_2\|_2 = \sqrt{\sum_i (x_i^{(1)} - x_i^{(2)})^2}$$
