## Vector and tensor norms

- Measure of the size, or magnitude of a vector or tensor
- Definition: The following criteria qualify  $f(\cdot)$  as a norm:
  - Positive definite:  $f(\mathbf{x}) = 0$  iff  $\mathbf{x} = \mathbf{0}$
  - Triangle inequality:  $f(\mathbf{x} + \mathbf{y}) \le f(\mathbf{x}) + f(\mathbf{y})$
  - Homogeneity:  $\forall \alpha \in \mathbb{R} : f(\alpha \mathbf{x}) = |\alpha| f(\mathbf{x})$
- The ones we care about are:
  - Lp norm:  $||\mathbf{x}||_p = \left(\sum_i |x_i|^p\right)^{1/p}$
  - Frobenius norm:  $\|\mathbf{A}\|_F = \sqrt{\sum_{i,j} A_{i,j}^2}$

## Distance metrics

• The two distance metrics used most often in machine learning are the Manhattan (L1) and Euclidean (L2) distances, which can be defined using the Lp norm:

• Manhattan: 
$$\|\mathbf{x_1} - \mathbf{x_2}\|_1 = \sum_i |x_i^{(1)} - x_i^{(2)}|$$

• Euclidean: 
$$\|\mathbf{x_1} - \mathbf{x_2}\|_2 = \sqrt{\sum_i (x_i^{(1)} - x_i^{(2)})^2}$$
