Expected value and covariance functions
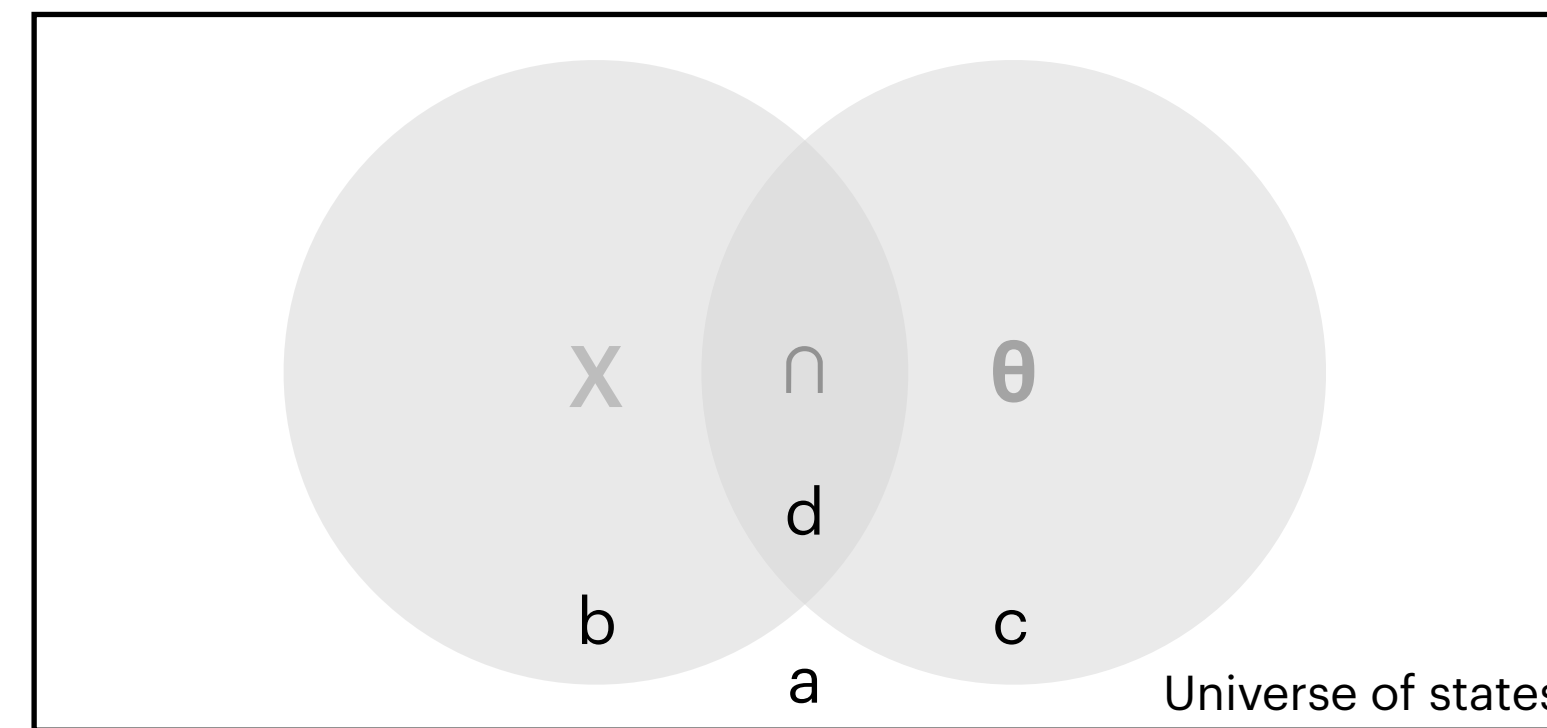

- Expectation: $\mathbb{E}_{x \sim P}[f(x)] = \sum_x P(x)f(x)$

- Variance: $Var(f(x)) = \mathbb{E}_x\left[\left(f(x) - \mathbb{E}[f(x)]\right)^2\right]$

- Covariance: $Cov(f_1(x), f_x(x)) = \mathbb{E}\left[\left(f_1(x) - \mathbb{E}[f_1(x)]\right) \cdot \left(f_2(x) - \mathbb{E}[f_2(x)]\right)\right]$

- Covariance of random vector, **x**: $Cov(\mathbf{x}, \mathbf{x}) = \mathbb{E}\left[(\mathbf{x} - \mathbb{E}[\mathbf{x}])(\mathbf{x} - \mathbb{E}[\mathbf{x}])^T\right]$

$$= \mathbb{E}\left[\mathbf{x}\mathbf{x}^T - \mathbb{E}[\mathbf{x}]\mathbb{E}[\mathbf{x}]^T\right]$$

Bayes' Rule

- Intuitive statement: $P(x|\theta)P(\theta) = P(\theta|x)P(x)$

- Proof $\quad \dfrac{d}{c} \cdot \dfrac{c}{a} = \dfrac{d}{b} \cdot \dfrac{b}{a} = \dfrac{d}{a}$

Universe of states

- Bayes' Rule follows by deduction: $\quad P(\theta|x) = \dfrac{P(x|\theta)P(\theta)}{P(x)} \qquad posterior = \dfrac{likelihood \times prior}{evidence}$

- Prescription for how to update a model given new evidence (i.e., new data)
